

Oil - the weapon of XXI century

The raw orientation of export of Russia does the country vulnerable from the exchange prices for energy carriers. The price is market and its collapse at world stock exchanges can put Russia, our economy and well-being of people on a side of a collapse. It is seen, but not the obvious fact.

The essence of economic that the market economy is the subject of religion and belief, i.e. practically completely is necessary on subjective factors. The second component will be objective laws of a supply and demand, and also attachment of economic to energy carriers and hydrocarbonic raw material as oil and natural gas.

Last years the price for oil is object of gamble of the western and Russian politicians and businessmen concerning to threats of sudden falling those. Russia continuously support in a condition of a fright for which overcoming to us recommend to accumulate gold and exchange currency reserves, to do a stabilization stock and to pawn in the future budgets the probable prices for oil in view of its probable falling. In result the economic situation in the country remains not stable, huge material means do not find application in economy, and are placed in foreign countries and to keep in currency the USA.

For restoration of statehood of Russia it is necessary for us to transform our lacks into advantages and to realize game management of an external problem, which is adjusted by market mechanisms. In the work « Virtual war of XXI century » I already wrote, that our problem is transformation the USA and the Western Europe in a technological appendage of Russia and its allies. For this purpose it is necessary for us to make the prices for oil and gas of objects of gamble at stock exchanges of the West, in the weapon of Russia on an establishment of the new world order as hegemony of Russia and its allies.

Indisputable there is a fact of raw dependence of the West from the countries of the East and the developing world. Without mineral oil all transport, manufacture of highly technological products and the polymeric industry will stop. In the winter all West will freeze, only in case of overlapping submission of gas on pipelines, catastrophic consequences will come also for an infrastructure of housing and communal services. All technological and material gains of the West become insignificant if they will not receive raw material and energy carriers. For leaving from dependence of oil and mineral oil, and also heating by gas, tens years on development of alternative energy sources and full replacement of a motor-vehicle pool, planes, systems of heating, polymeric materials will be necessary for the West. Escalating of capacities of nuclear electric power industry also is doubtful owing to presence of the public opinion generated by the various ecological organizations of the West. In any case leaving from power dependence of the West on the East will need hundreds and hundred billions dollars, stagnation in economy and infringement of a habitual level and quality of a life of the western inhabitants. The decision of questions of power safety of the West also is connected to threat of application of military force, but even threat of application of force will affect negatively pricing of world raw stock exchanges in sense of their sharp growth.

Accordingly, even virtual game with pricing a source of raw materials will be the legitimate and accessible weapon in questions of maintenance of economic safety of Russia and its allies for all twenty first century. The West will be compelled to try to struggle with our pressure lawful means of the market, but cannot threaten with application of military force, since the world community any more to a colony of the West, and the independent and independent states.

The primary goal of virtual pricing will be finishing the price for export gas up to 200 dollars for 1000 meters cubic and a raising of a price corridor on oil up to 150-200 dollars for barrel. The output on such price level will allow to strengthen dependence of the West on Russia and its allies, to restore statehood of Russia, to make the West more compliant and compliant in questions of Freedom and Democracy. Russia can publicly assert principles and values of Orthodox Freedom and Democracy, to carry out peace competitive rivalry between our and western values.

The offer will rise in the price for energy carriers with pleasure is perceived by the countries exporters of oil and gas, members ОПЕК, the largest world concerns on manufacture and oil refining and gas, practically half of world elite of the West which have made the conditions on power resources. As allies Russia will receive all oil-producing countries and Puritan elites of the West. For all will be determining a sound of money at them in pockets, instead of possible threats of a victory of Russia in ideological war. We suggest all to become the richman, instead of to pay money for preservation of the capitals. For realization of this doctrine there is no necessity of insertion of huge means, there is enough message the systematic and organized work on continuous increase of the prices for energy carriers. Such activity has extremely virtual and organizational character.

To avoid social explosions and problems in economy of own countries it is necessary to divide the internal prices and the prices export. Russia needs first of all opening of own joint-stock State Commodity - raw Stock exchange on energy carriers, raw material and the goods made in Russia, introduction of uniform quotations depending on a place of sale of the goods both inside the country, and on export.

For raw material - quotations on chinks, DDU, OPF, storehouses, refuellings, borders, customs houses and ports. Sale of the goods and services to any consumers only for rubles. Familiarizing with trade in oil and mineral oil of the country OPEK and independent manufacturers in a ruble zone. The state warranting of safety of capitals and means of our partners on trade in power resources.

For virtual management of questions of pricing of power resources maintenance of specially prepared program of increase of the exchange price proceeding from a principle - economy the subject of religion and belief is necessary. For this purpose continuous enough psychological pressure upon participants of the exchange tenders and real consumers. This process will go on a background of objective increase of demand for energy carriers owing to growth of economic and limitation of world reserves of oil and gas. Gradual connection of the countries having stocks of raw material, to trade through the Russian stock exchange and for rubles, storage of capitals in a ruble zone, skilful propagation of limitation of world resources and actual impossibility sharp a raising of a level of extraction of power resources will lead to systematic increase of the exchange prices.

For Russia the main problem leaving of trade by own power resources through intermediaries of the West, mainly known nationality also begins, to trade through the broker firms and is direct with end users. Familiarizing with this process of our partners and allies on trade in power resources. Exception of exchange trade of an infrastructure of the West as memory systems, reserves and other buffers regulations of pricing. For leaving from developed practice application of force-major circumstances with change of legislative base and the conclusion of new intergovernmental agreements is necessary.

In a case переориентирования the West on own stocks of natural raw material, and also threat of application of military force for regulation of the market of energy carriers, there is a bargaining chip - threat of the international terrorism created under the order of the West and groups of anonymous authority. The international terrorism can unexpectedly become angry to oil-extracting chinks, oil-and gas tube systems, tankers and bulk-oil terminals. Application of military force against probable acts attack to an infrastructure of energy carriers will promote also to growth of consumption of mineral oil, and also increase of the prices for them.

Masterly management of pricing on energy carriers will allow to leave on a price level comprehensible on the present moment which will be supported or change in view of our strategic interests, and also interests of our friends and allies.

Repeated increase of the world prices for energy carriers will affect rise of the cost price of the technological and household goods of the West, but this increase will touch only 10-20 %% from the cost price of the goods and services. In a result increase of the prices for energy carriers will lead to a rise in prices on the goods no more than on 50 % of the existing cost. Finally the rise in prices on energy carriers stimulates the next scientific and technical revolution in all spheres of manufacture and technologies, switching энергосберегающие and new, hitherto not known. To economic it will be on advantage.
